Animal Based Diet (Automated System)

This is a 5-step system to rewire your body, brain, and biology to run effortlessly on an animal-based rhythm — without counting, tracking, or second-guessing what you put into your body. Each step teaches you exactly what to eat, when, and why — while automating the internal behaviors that make it sustainable for life. I call it the AB-OS. Animal Based Operating System.

Simply put, your body doesn't build muscle, hormones, neurotransmitters, or skin from grams. It builds them from amino acid quality and form. Macronutrients fuel your body. Micronutrients fine-tune your body. Bioavailability ensures your food actually gets used. Metabolic flexibility gives your body range to perform. Simplicity gives it peace. Put them together? That's not a diet its a system.

START HERE

Macronutrients

1 WHAT	2 WHY	3 HOW
Macronutrients are nutrients you need in large amounts to survive & thrive. They are your fuel & structure. **Protein, fat and carbs are the three primary macronutrients the human body is built from and runs on.** Protein builds the body. Fat fuels & regulates it. Carbs enhance recovery and performance when used intentionally.	Every part of you—muscle, skin, enzymes, hair, even neurotransmitters—is made of protein molecules built from amino acids. If you're not getting enough protein, your body starts pulling from itself. That means muscle loss, weak immunity, and slow repair. Fat is needed to make hormones (testosterone, estrogen, cortisol), coat your nerves, and absorb key vitamins (A,D,E,K) No fat = No absorption. No mental clarity. No fuel when carbs run out.	Eat ruminant meat 2–3x daily – beef, lamb, bison. Always include animal fat: tallow, butter, suet, egg yolks. Aim for 1g of protein per 1lb of ideal body weight, naturally (don't track – just stack meals around meat). Use carbs (fruit/honey) after output, not to "start the engine"

⭐The body is made up of 20 amino acids. 9 are essential—you can't make them yourself. Ruminant meat (beef, lamb, bison) gives you all 9, plus creatine, carnosine, and taurine—which plant proteins don't.

⭐Macronutrients are the bricks. Micronutrients are the builders and blueprints. If you eat only macros with no micros, the body can't repair or regulate. If you only chase micronutrients (like in supplements), the body still starves for real energy. You need both, working together.

Micronutrients

1 WHAT	2 WHY	3 HOW
Micronutrients don't give you calories, but they give you capacity. These are the behind-the-scenes operators—vitamins and minerals that quietly direct everything from digestion to dopamine. You need them in trace amounts, but without them, nothing runs right. Your metabolism stalls. Your hormones misfire. Your brain lags.	Micronutrients tell your body how to think, move, grow, and recover. Think of them like software updates for your operating system. Without them, your body doesn't break—it just runs clunky, slow, and glitchy. Vitamins like A, D3, K2, and B12 unlock potential you didn't know was offline: stronger bones, clearer thinking, sharper vision, faster healing. And minerals? They're the electricity behind it all—literally. They carry signals from your brain to your muscles, help you absorb energy from food, and stabilize the rhythms that keep you alive. When you're low, it's a delay in power. You're pressing the gas, but the signal's lagging. Without them, you're not running the full version of yourself.	Don't supplement. Saturate – with real food. Stop chasing numbers—start feeding biology. • Eat bioavailable nutrients from real food: liver, bone broth, raw dairy, eggs, and salt. • Add salt daily to meals (start with 1 tsp/day minimum). • Rotate organs weekly (start with liver once/week, blended in ground beef). • Use raw dairy for calcium and natural probiotic support. When you nourish at the cellular level, your body stops guessing—and starts performing.

⭐The majority of people aren't underfed — they're undernourished and are chronically low in magnesium, sodium, and potassium after years of eating processed food and drinking caffeine without replenishing electrolytes. Increasing minerals will reverse deficiencies that lead to anxiety, fatigue, and poor sleep. Make everything else you eat work better.

⭐If your nutrients aren't bioavailable, you might be eating "healthy"... but still missing what your body actually needs. You could eat all the salads, powders, and multivitamins in the world... But if your body can't absorb what's inside? That's like filling your gas tank with water and wondering why your car won't move. Most "healthy foods" foods are chemically loud and hard to digest. They deplete more than they deliver.

System Stability

1 WHAT	2 WHY	3 HOW
Systems stability is your body's ability to stay calm under pressure, respond to stress without spiraling, digest food properly, keep energy steady, and recover like a pro. It's your nervous system and metabolism syncing up—your hormones firing in rhythm.	You could be eating right and training hard—but if your system isn't stable, your body treats those inputs like stress. That means you hold fat, you underperform, and you never feel quite "right." Stability is what lets your body respond instead of react. And that's how you build long-term health and performance.	How to gain stability? It's simple.. keep it simple. This is an important, final step in your journey to animal based lifestyle. Simplicity means eating a repeating pattern of real foods, not chasing variety.The human body thrives on predictability. Your gut microbiome, nervous system, and hormones respond best to consistency.

⭐You feel tired for no reason. You crash after meals. You overreact to stress. You can't recover from workouts. You sleep 8 hours and still feel wrecked. That's system instability. Your body's trying to run a Formula 1 race with flat tires and a wobbly engine.

⭐ Remember, bloat, burps, and bathroom changes tell you more than MyFitnessPal ever will. Simplify until your body feels quiet after eating.

Bioavailability

1 WHAT	2 WHY	3 The Perfect Headline
Bioavailability means how well a nutrient gets from your plate to your cells in a usable form. Most plant foods come with anti-nutrients like phytic acid, lectins, and oxalates that block or reduce absorption of key minerals like zinc, calcium, and iron. They require enzyme conversion, fermentation, or gut adaptation. Think of it like mail delivery: plant foods come with locks, delays, and wrong addresses. Animal foods? Express, overnight, front door.	Better absorption = faster healing, deeper energy, and fewer cravings. Your gut doesn't get inflamed from guessing what to do with your food. Less digestive stress = more nervous system calm = more metabolic trust. Nutrients only matter if they get in the cell. Animal-based foods require no conversion.They match human biology in structure and function. Our cells don't run on food they run on usable nutrients, and animal-based foods deliver them in their most active, absorbable form. Vitamin A from liver hits different than beta-carotene from carrots. Heme iron from steak gets absorbed almost three times better than iron from plants. Even minerals like zinc, magnesium, and calcium.	To get the most from your meals, you've got to eat for bioavailability and prime your gut to actually absorb it. That starts before the first bite. About 10–15 minutes before eating, sip warm bone broth, ginger tea, or hot water with sea salt—this wakes up your digestive system, boosts stomach acid, and puts your body in "rest and digest" mode. Cold guts don't break down real food well. Then build your plate around ruminant meats like beef or lamb for direct-access protein, iron, and B vitamins.

Metabolic Flexibility

1 WHAT	2 WHY	3 HOW
Your metabolism was designed to burn fat at rest and use glucose (sugar) during stress, movement, or repair. ***Metabolic flexibility is your body's ability to switch between fuel sources like fat and carbohydrates without crashing.*** It's like a hybrid car. Sometimes you run on gas (carbs), sometimes on electric (fat). The key? You can shift gears smoothly.	***You can have all the stored fat in the world—but if your body doesn't know how to access it, it just sits there.*** That's one of the real reasons people struggle with excess weight. It's not always about overeating—it's about under-burning. Your metabolism becomes reactive instead of responsive. You feel tired after meals, foggy in the afternoons, and anxious if you go too long without food. Your system is locked in sugar-burn mode, and fat loss becomes a fight.	You rebuild metabolic flexibility by removing the noise and feeding your body real, absorbable food. That means cutting out processed carbs, seed oils, and grazing habits. Instead, center your meals around ruminant meats, whole eggs, raw dairy, and animal fats like tallow or ghee. These stabilize blood sugar, keep insulin low, and retrain your body to use fat for energy. ***Once your system recalibrates, you reintroduce power carbs strategically—like raw honey, fruit, or fermented dairy—timed around physical activity, not scattered across the day.***

⭐ Every time you go longer between meals without crashing, your body gets more efficient. Every time you move or lift without sugar in your system, you teach it how to burn fat again. And every time you prioritize nutrient-dense, bioavailable foods, you're feeding the system that fuels your life.
